Following is a procedural specification that we recommend for backfill of utility trench excavations that encroach within 2½ feet of the exterior edge of structural foundations.

Utility trench backfill to be placed within 2½ feet of the exterior edge of structural footings should be placed in lifts, with each lift uniformly moisture conditioned to at least optimum moisture content. The initial lift over the utility conduit may be 12 inches in loose thickness and should be uniformly compacted with a minimum of two complete passes using a wacker type compactor. Subsequent lifts should be placed in eight inch lifts, with each lift receiving a minimum of three complete passes of the compaction equipment. Compaction need only be applied to backfill below the depth of the footing and within 2½ feet of the outside edge of footings.

It is the intent of this specification that backfill be compacted to a uniform firm condition, exhibiting moderate resistance to hand probing. Provided these recommendations are followed, it is our opinion that the backfill will provide suitable support for the existing house foundations.
