In accordance with City of Sacramento special inspection requirements, our firm has performed *Special Inspection and Testing* in accordance with Sections 106 and 1701 of the Uniform Building Code for the subject project. Our observation and test results indicate that the following items were constructed, to the best of our knowledge, in accordance with the project's plans and specifications:

Observed reinforcing steel, post-tensioning tendons and concrete placement for multi-family residential slabs-on-grade for buildings constructed at the subject project. Performed slump and temperature tests and molded cylinder samples from the fresh concrete. Performed for laboratory compressive strength tests.

Monitored stressing operations for post-tensioned slab tendons, recorded and reported compliance with contract document calculated elongation requirements prior to tendon tail cut-off.

During timber framing operations, the Building Department noted deficiencies in sill and hold-down bolt quantity, size and locations. Additional bolts were required to be epoxied into place to satisfy Building Code requirements. Wallace-Kuhl & Associates representatives observed the size, depth and cleaning of the drilled retrofit anchor holes and observed the installation of the bolts in accordance with the epoxy system manufacturer's instructions.

NOTES:

Due to lack of prior notice or notice of incorrect time of concrete placement, no WKA representative was on site during approximately 5-10% of post-tensioned slab concrete placement. To the best of our knowledge, tendon placement for these areas had been inspected prior to concrete placement and subsequent post-tensioning operations were accomplished without incident.

WKA No. 3430.09
WKA No. 3430.10

Several 28-day cylinder tests did not meet the 3000 psi design compressive strength. Extra cylinders from each set that did not meet strength were tested at age 56 days. With one exception, all of the 56-day tests exceeded the 3000 psi design strength. Cylinder samples from concrete placed in the center slab of Building 2 at Miramonte achieved 2850 psi or 95% of design strength at age 56-days. Acceptability of 56 day breaks as satisfying design strength requirements should be determined by the project Architect or Engineer of Record.

Except as noted above, to the best of our knowledge post-tensioned concrete construction and epoxied anchor installation met project construction document and Uniform Building Code requirements.
