ESTIMATED COST, \$ 501

Plans must be submitted

W. McPherson
Owner or Owner's Representative.

1. The first step in the process of identifying a problem is to define the problem. This involves identifying the symptoms and the underlying causes of the problem. For example, if a company is experiencing a decline in sales, the first step would be to identify the specific areas where sales are declining and to determine the reasons for this decline.

2. The second step is to gather information. This involves collecting data and information that will help to identify the problem and its causes. This can be done through a variety of methods, including interviews, surveys, and data analysis.

3. The third step is to analyze the information. This involves identifying the key factors that are contributing to the problem and determining the relationships between these factors. This can be done through a variety of methods, including SWOT analysis, PEST analysis, and Porter's Five Forces.

4. The fourth step is to develop a solution. This involves identifying the most effective and efficient way to address the problem. This can be done through a variety of methods, including brainstorming, decision trees, and cost-benefit analysis.

5. The fifth step is to implement the solution. This involves putting the solution into action and monitoring its progress. This can be done through a variety of methods, including project management, quality control, and regular communication.

6. The sixth step is to evaluate the results. This involves assessing the effectiveness of the solution and determining whether the problem has been resolved. This can be done through a variety of methods, including surveys, interviews, and data analysis.
