Dear Mr. Bartels,

The historic building under renovation, Casa Del Rey, is a four-story structure with the first story consisting of typical footings and a concrete exterior wall approximately 14' in height. The top three stories are typical wood framing in nature with nominal 3x4 studs, sills, headers and plates. Stud layout is 16" on center. Floor and rim joists are nominal 2x10 or greater. The front "south" face of the building has been stripped of stucco to address windowsill leakage problems. Existing wood walls consist of diagonal 1x8 sheathing with a 3 and 2 nailing pattern, which meets the historic building requirements for shear resistance.

Dry rot was found in some of the diagonal sheathing members located directly below the south side window sills, which can be attributed to the leakage issue. This dry rot does not appear to have penetrated into any wood frame members of the building. Also, the dry rot in the sheathing below typical windowsills is not located in areas contributing to the shear capacity of the structure. Therefore, it is recommended that the sheathing with visible dry rot be removed and replaced with a comparable material or better (i.e. replace with similar 1x8 sheathing and match existing nailing pattern or install perimeter nailer blocks and 3/4" CDX plywood with a 6 and 8 shear nailing pattern where required).

If there are any questions pertaining to this recommendation, please contact our firm to discuss.

Sincerely,
JDC ASSOCIATES

DAVID A. CRANE,
Structural Engineer
